

Why is it important to use a valved holding chamber or spacer with your inhaler?

Inhaler only

Medicine can end up in the mouth, throat and stomach which may cause side effects.

Inhaler with spacer

More medicine is delivered to the lungs where it can be most effective.

Helps reduce the risk of inhaler side effects^{5, 6, 7, 8, 9, 10, 11}

Aerosol medicine comes out of the inhaler very quickly so it is often very difficult to use an inhaler correctly because the canister needs to be pressed at the same time as you breathe in.^{12, 13}

Enhances your treatment

Medicine often ends up in your mouth, throat and stomach when using an inhaler on its own. A valved holding chamber may improve drug delivery to the lungs where it is needed by as much as up to 4 times.¹⁴

PHILIPS

OptiChamber Diamond

Valved holding chamber

Designed to improve medication delivery

innovation  you

Improve medication delivery

Valved holding chambers are designed to enhance delivery of commonly prescribed pMDI medications. The Philips' OptiChamber Diamond valved holding chamber is discreet, portable and small enough to carry with you in your handbag or in your child's school bag. It is designed to allow more aerosolized medication to be delivered efficiently.¹

There's always a way to make life better.

Designed to enhance delivery of your pMDI medication

Helps coordination

The anti-static chamber suspends medication longer,² giving you more time to inhale.

Shortens treatment times

The effective seal of the LiteTouch mask means that the chamber can be cleared in less than 3 pediatric breaths.³

One size works for all

The stepped mouthpiece makes the OptiChamber suitable for use by children* and adults without any configuration.

* Under adult supervision

Device feedback

A flow alert whistle let you know if you are breathing in too quickly.
